ABSTRACTED-PUB-NO: SU 1396103A

BASIC-ABSTRACT:

The input radio-signal, containing information about range, passes through a
phase **rectifier**, amplifiers and a summer to **integrator** (25), forming a voltage
proportional to the phase of the received signal, used to adjust the reference
signal through phase shifter (14). This ensures a more accurate **phase**

adjustment of the reference reference signal for synchronous rectifier (1) and the pahse rectifier, constricting the passband of both radio-technical channels without increasing the dynamic inaccuracy. USE - Measurement of range.
